We Claim:

1. A method for determining an optimum access strategy in a configuration for processing data processing processes, the method which comprises:

providing the configuration for processing data processing processes with an operating system allowing at least one system resource to process system processes when an application is carried out;

with the system resource, using different access strategies to process an application or a system process;

after testing all of the access strategies, assigning a value corresponding to an execution speed of the application or the system processor to each of the access strategies; and

storing the value.

2. The method according to claim 1, which further comprises: enabling a user of the system to determine an optimum access strategy at any time.

3. The method according to claim 1, which further comprises:

providing a plurality of system resources; and

determining an optimum access strategy for each individual one of the plurality of system resources.

4. The method according to claim 1, which further comprises:

providing a plurality of system resources; and

for an application, determining a uniform optimum access strategy for all of the plurality of system resources.
